7.52.0 New Features

This guide lists new features available in **eTapestry** 7.52.0, released on October 20, 2019.

Custom Home Page: Email Performance

To view performance statistics for your organization's advanced mass email jobs, you can now add the **Email Performance** tile to your custom home page. You must have sent an advanced mass email in the past 60 days in order for information to appear.

Email Performance displays details such as:

- **Attempted:** The amount of emails that were attempted for the mass email.
- **Successful:** The amount of emails that were successfully sent from the mass email.
- **Opened:** The number of unique times an email was opened. If a recipient opens the email more

than once, it will only be counted as one open.

- **Clicked:** The number of unique times each trackable link within the email was clicked. If a recipient clicks the link more than once, it will only be counted as one click.

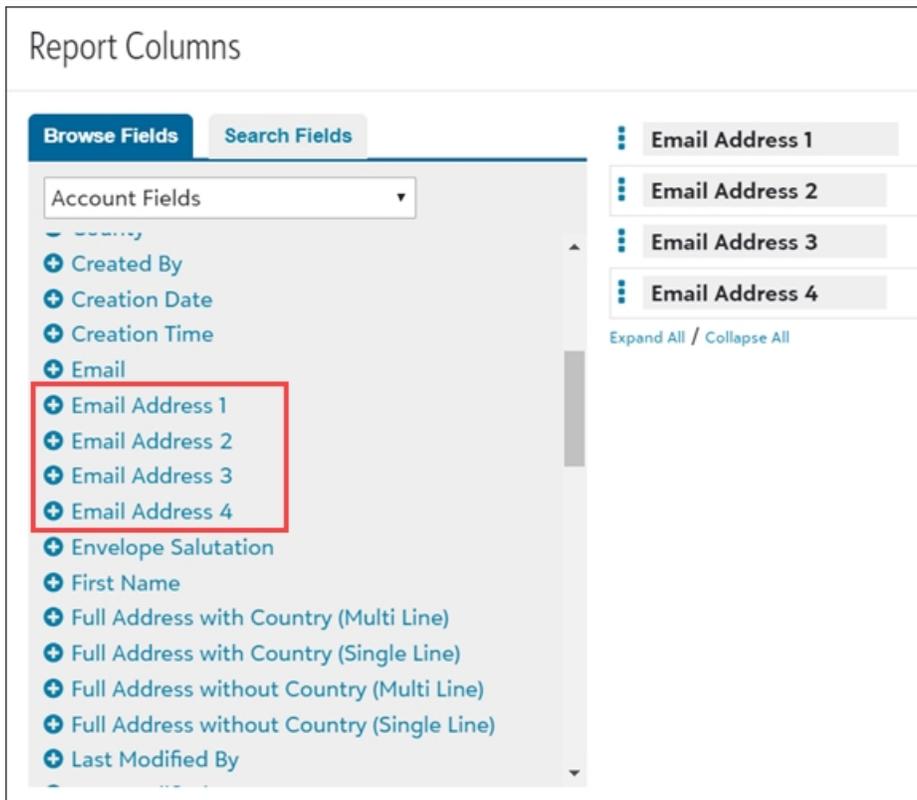

Tip: Active, test, and spam emails are excluded from the totals.

To add or remove **Email Performance**, click **Select Tiles and Layout** on the Home page. Mark or clear **Email Performance** and select **Save**.

Reports: Export Multiple Email Addresses

You can now export multiple email addresses as separate fields. Previously, you would need to export all email addresses in a single field.

Note: You will still need to export email addresses in Query Preview and Find Account as you did before.

To add multiple email fields to a custom report, under **Report Columns**, choose Account Fields in the drop down menu. Select the amount of email address fields to display on the report.

For more information, see [Create a custom report](#).

User Defined Field Sets

To make it easier for you to add a basic or advanced defined field set, you can now add defined field sets from **User Defined Fields** without leaving the page.

From **Management, User Defined Fields** select **Add Defined Field Sets**. To select a defined field set, click the name of it. A list of all defined fields for that set appears.

By default, all fields and options are selected for you to import. To exclude a field you do not need, clear its checkbox. When you exclude all options for a field, the field does not import.

To add the defined field set, select to import it. For more information, see [Defined Field Sets](#).

Search: International Address Fields

You can now search on the following fields from the search bar, quick find search, and Outlook Integration search:

- **Street Name**
- **Building Number**
- **Apartment Number**

For more information, see [Find Accounts](#).
